-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

## Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

## Status

- 1) ☒ Responsive to communication(s) filed on 17 September 2007.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

## Disposition of Claims

- 4) ☒ Claim(s) 1-14 and 17-23 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-14 and 17-23 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

## Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

## Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
  - ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

## Attachment(s)

- ☒ Notice of References Cited (PTO-892)
- ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- ☐ Information Disclosure Statement(s) (PTO/SB/08)  
Paper No(s)/Mail Date \_\_\_\_\_
- ☐ Interview Summary (PTO-413)  
Paper No(s)/Mail Date. \_\_\_\_\_
- ☐ Notice of Informal Patent Application
- ☐ Other: \_\_\_\_\_

### **DETAILED ACTION**

Claims 1-14 and 17-23 were rejected in the Office Action entered on 23 July 2007.

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 17 September 2007 has been entered.

The 17 September 2007 submission has amended claims 1, 7, 14, and 21-23. Claims 1-14 and 17-23 are pending in this application.

Claims 1-14 and 17-23 are rejected.

### ***Priority***

1. This Application contains a claim for the benefit of priority to U.S. Provisional Application No. 60/243,708 filed 26 October 2000. The provisional application has been reviewed and priority is denied, because the provisional application does not appear to enable the claimed invention as required under 35 U.S.C. Section 112, first paragraph. See 35 U.S.C. § 119(e)(1).

For example, the provisional application contains a set of 'powerpoint-style' drawings and datasheets describing desired features for a microcontroller or a 'system-on-chip,' but this material does not appear to contain either the text description or the drawings found in the

Application. In particular, no part of the provisional application appears to disclose the method steps shown in the Application at Fig. 7.

### ***Double Patenting***

2. In response to the amendments to independent claims 1, 7, and 14, the previous double patenting rejections under 35 U.S.C. § 101 are withdrawn.

### ***Response to Arguments***

3. In response to the previous rejections of claims 1-14 and 17-23 under 35 U.S.C. § 103 as being unpatentable over Marik in view of Grunert, Applicants argue primarily that:

[...] Independent Claim 1 recites the limitations, "a microcontroller", and, "a virtual microcontroller, which is not identical to and emulates operation of the microcontroller." In contrast, Grunert states, "the invention, for in circuit emulation comprises two identical microcontrollers" [...]

The Examiner has fully considered this argument and finds it persuasive. The previous rejection has been withdrawn. New grounds of rejection are entered below.

### ***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. § 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. § 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. § 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. § 103(c) and potential 35 U.S.C. § 102(e), (f) or (g) prior art under 35 U.S.C. § 103(a).

4. Claims 1-14 and 17-20 are rejected under 35 U.S.C. § 103(a) as being unpatentable over US Patent No. 5,903,718 to Marik in view of US Patent No. 6,366,878 to Grunert, and further in view of US Patent No. 5,438,672 to Dey.

Regarding claim 1, Marik teaches:

An in-circuit emulation system [*"The Debug Tool of a preferred embodiment of the present invention is a 8031 debug tool with emulator types of functions which needs only a minicomputer, such as a PC, running a user-interactive PC Host Debugger Application program and a serial cable attaching the standard communication port of a PC to the 8031 based target*

system.” (column 3, line 66 – column 4, line 4)] breakpoint control [“*Debug Parameter Table*” (column 6, lines 48 *et seq.*)] comprising:

A microcontroller [“*According to the present invention, a remote program monitor method and system using a system-under-test microcontroller for self-debug comprises a system-under-test (SUT\_ that includes a read-only memory (ROM) and a microcontroller for executing a program under test.*” (column 2, lines 22-27)];

A breakpoint lookup table, wherein said breakpoint lookup table comprises a plurality of break bits associated with a sequence of instruction addresses, and wherein each of said sequence of instruction addresses has a corresponding break bit, the break bit being set to indicate that a break is to occur at a specified instruction address [“*The Debug Parameter Table contains a record for each specified debugpoint in the target system. Each record consists of: 1) A program memory address which is compared to the target system program counter at the time the debugpoint occurs. If a match occurs, the debugpoint takes action based upon the contents of the remainder of this record.*” (column 6, lines 48-61); in the claimed embodiment, a debugpoint would be established for each instruction in a sequence of instructions];

A breakpoint controller that sends a break message to the microcontroller whenever an instruction address is encountered that is associated with a set break bit [“*When the SUT receives one or more debugger signals as an interrupt input, the signal causes the microcontroller to execute a debugger program contained in the ROM.*” (column 2, lines 22-38); “*When a debugpoint is reached, the INT0 interrupt handler checks the Debug Parameter Table to verify that the breakpoint is enabled. A break is enabled if the Break Boolean flag is set true and the*

*program counter value in the Debug Parameter Table matches the program counter at the top of the stack upon entry into the INT0 interrupt handler.” (column 16, lines 19-35)].*

**Marik does not disclose a virtual microcontroller operating in lock-step synchronization with the microcontroller by virtue of their identical operation.**

Grunert teaches a virtual microcontroller operating in lock-step synchronization with a microcontroller by executing the same instructions using the same clocking signals [*“The arrangement, according to the invention, for in-circuit emulation comprises two identical microcontrollers, which are operated as master and slave, as well as the external program memory. The slave receives the same program instructions parallel to the master.”* (column 1, lines 47-65); *“In accordance with another feature of the invention, a clock synchronizes the two microcontrollers (2, 3).”* (column 2, lines 58-59)].

Grunert and Marik are analogous art because both are directed to microcontroller development and testing.

It would have been obvious to a person of ordinary skill in the art at the time of Applicants’ invention to combine the teachings of the virtual microcontroller operating in lock-step synchronization with the teachings of Marik’s debugging system to arrive at the claimed invention. The combination would involve the desirable features of Marik’s debugging system with the desirable features of Grunert’s virtual microcontroller system.

The motivation for doing so would be to achieve better visibility into the internal operations of the microcontroller, as expressly taught by Grunert [*“In accordance with an*

*advantageous feature of the present invention, the operating program for in-circuit emulation is not stored in the internal ROM memory, but in an external, and therefore easily accessible memory." (Grunert, column 1, lines 36-47); "Internal states of the master 2 are transmitted to the slave 3 via the ports P3, P4', and then to the service computer via the ports P5', P6',.... The contents of the memory 4 can be changed by the service computer, in order to optimize the microcontroller in the application system during the development phase. The internal state of the master 2 can be traced by setting breakpoints. The service computer executes the application program in this case in parallel with the execution in the master 2." (Grunert, column 5, lines 10-25)].*

**Marik in view of Grunert does not expressly teach that the virtual microcontroller and microcontroller are not identical.**

Dey teaches a microcontroller emulator that is not identical to a microcontroller [*"...a configurable emulator system in accordance with the present invention provides full emulation for a variety of microcontroller architectures, as compared to conventional emulator systems that provide only a minimal set of options." (column 2, lines 57-63); FIG. 1; etc.].*

Dey and Marik in view of Grunert are analogous art because all are drawn to microcontroller development and testing.

It would have obvious to a person of ordinary skill in the art at the time of Applicants' invention to combine the teachings of Dey and Marik in view of Grunert to achieve a reconfigurable emulator capable of emulating a variety of microcontrollers being tested and/or

developed, as expressly taught by Dey [*"Before the user's microcode is built into the microcontroller, it is desirable to verify the functionality of the code. Typically, an emulator device and a development system are utilized for this purpose. The emulator device provides all of the hardware functionality available in the microcontroller and, in addition, is capable of accessing external program memory. The development system provides the external program memory that stores the user's microcode. The development system also includes test mechanisms for debugging the user's microcode. The problem has been that each variation in microcontroller architecture requires its own individual emulator."* (column 1, lines 49-63); *"Thus, a configurable emulator system in accordance with the present invention provides full emulation for a variety of microcontroller architectures, as compared to conventional emulator systems that provide only a minimal set of options."* (column 2, lines 57-62)]. Thus, by combining the teachings of Dey with Marik in view of Grunert, Grunert's "virtual microcontroller" would be enhanced by becoming reconfigurable and compatible with a variety of microcontroller architectures.

Therefore it would have been obvious to a person of ordinary skill in the art at the time of Applicants' invention to combine the teachings of Marik, Grunert, and Dey to obtain the invention specified in claim 1.

Regarding claim 2, Grunert teaches that messages are sent to the microcontroller over an interface linking the (master) microcontroller to the (slave) virtual microcontroller [*"A signal connection between the microcontrollers 2, 3 is produced by port P3 in the master and port P4'*

*in the slave. The respective settings of the connecting devices 9, 9' ensure that the ports P0', P2', P3' of the slave 3 are switched through to the master 2 so that all the input and output data of the function unit 7 are available in the master 2 as in normal operation."* (column 4, lines 63-67); *"The corresponding ports P5', P6' are therefore free in the slave 3, with the result that they can be used for inputting and outputting further internal signals and states, for example internal buses, control signals, register contents, etc. or for controlling the program execution."* (column 5, lines 10-25)].

Regarding claim 3, Marik teaches a counter that increments through the breakpoint lookup table as a sequence of instructions is executed [*"The Debugger Routine compares the program counter at the top of the stack upon entry into the INT0 Reentrant Routine with the program counter field of each record in the DPT until a match is found. If a match is found, the "active" DPT record is replaced by the new matched record. The debug Boolean flags in the DPT record dictate what action is to be taken."* (column 14, lines 59-65)]

Regarding claim 4, Marik teaches a host computer that programs the breakpoint lookup table to set a breakpoint bit at an instruction address where a break is to occur [*"To selectively disable or enable debugpoints, the PC host 10 can update the Debug Parameter Table of Boolean flags."* (column 15, line 50 – column 16, line 3); *"Initially, the target system 8031 source code is assembled on the PC."* (column 8, lines 4-22); *"Included in the assembly of the target system source code is the Debug Parameter Table and "enable INT0 interrupt"*

*instructions placed at strategic locations where debugpoints are desired.” (column 8, lines 34-52)].*

Regarding claim 5, Grunert teaches that the microcontroller and the virtual microcontroller operate in a two phase cycle comprising a control phase and a data transfer phase [control phase: *“The corresponding ports P5’, P6’, are therefore free in the salve 3, with the result that they can be used for inputting and outputting further internal signals and states, for example internal buses, control signals, register contents, etc. or for controlling the program execution.”* (column 5, lines 10-25); data transfer phase: *“Internal states of the master 2 are transmitted to the slave 3 via the ports P3, P4’, and then to the service computer via the ports P5’, P6’, .... The contents of the memory 4 can be changed by the service computer, in order to optimize the microcontroller in the application system during the development phase.”* (column 5, lines 10-25)].

Regarding claim 6, Grunert teaches that the break message is sent during the control phase [ *“The corresponding ports P5’, P6’, are therefore free in the salve 3, with the result that they can be used for inputting and outputting further internal signals and states, for example internal buses, control signals, register contents, etc. or for controlling the program execution.”* (column 5, lines 10-25); *“The internal state of the master 2 can be traced by setting breakpoints.”* (column 5, lines 10-25)].

Regarding claim 21, Grunert teaches that the virtual microcontrollers emulates said microcontroller [*“The object of the invention is to reduce the outlay for providing a microcontroller suitable for in-circuit emulation.”* (column 1, lines 34-36)].

Claims 7-10, 12-13, and 22 recite combinations of limitations found in claims 1-6 and 21. As claims 1-6 and 21 are obvious over Marik in view of Grunert, claims 7-10, 12-13, and 22 are similarly obvious over Marik in view of Grunert.

Regarding claim 11, Marik teaches halting execution of instructions in the microcontroller prior to the instruction associated with the set break bit [*“When a debugpoint is reached, the INT0 interrupt handler checks the Debug Parameter Table to verify that the breakpoint is enabled... The INT0 routine will then invoke the Communication API to transfer the contents of the trace table to the PC host 10 for display, then query the Communication API for a message from the PC host 10 to continue processing the target system code 40.”* (column 16, lines 19-35)].

Claims 14, 17-20, and 23 recite combinations of limitations found in claims 7-13 and 22. As claims 7-13 and 22 are obvious over Marik in view of Grunert, claims 14, 17-20, and 23 are similarly obvious over Marik in view of Grunert.

### ***Conclusion***
